AB - J02052040 Absorbent of ethylene (I) is made of cupric salt, reducing
agent, and porous carrier that carries cuprous salt. The method of
preserving the freshness of plants using (1) is disclosed.
- USE/ADVANTAGE - Available for mfg. absorbent of ethylene, applicable
to the preservation of the freshness of fruit and flowers. Flowers and
fruit, after they have been cropped, maintain life by transforming
organic substances to energy, and generating CO₂, H₂O, and ethylene.
Ethylene is the plants hormone that makes the fruit ripen and promotes
buds to flower. This product is safe, easy to handle, has high
absorbing capacity for ethylene, and can be easily regenerated by dry
inert gas.
- In an example, (1) activated carbon, (2) activated alumina, (3)
titanium oxide, and (4) bentonite are immersed into 6% aq. soln. of
cupric sulphate then added 10% aq. soln. of ferrous sulphate and made
cuprous salt to ppte on the carrier, filtered and heated in the
nitrogen gas at 100 deg C. 0.5 g of the absorbents were put into 200
ml of glass container which was filled with air contg. 500 ppm of
ethylene, after 30 mins. conc. of ethylene decreased to 2-5 ppm,
whereas in case of carrier alone (1)-(4) the concn. of ethylene were
1221-495 ppm.(0/1)
